

I started by opening the animator and animations page and also updating the input System

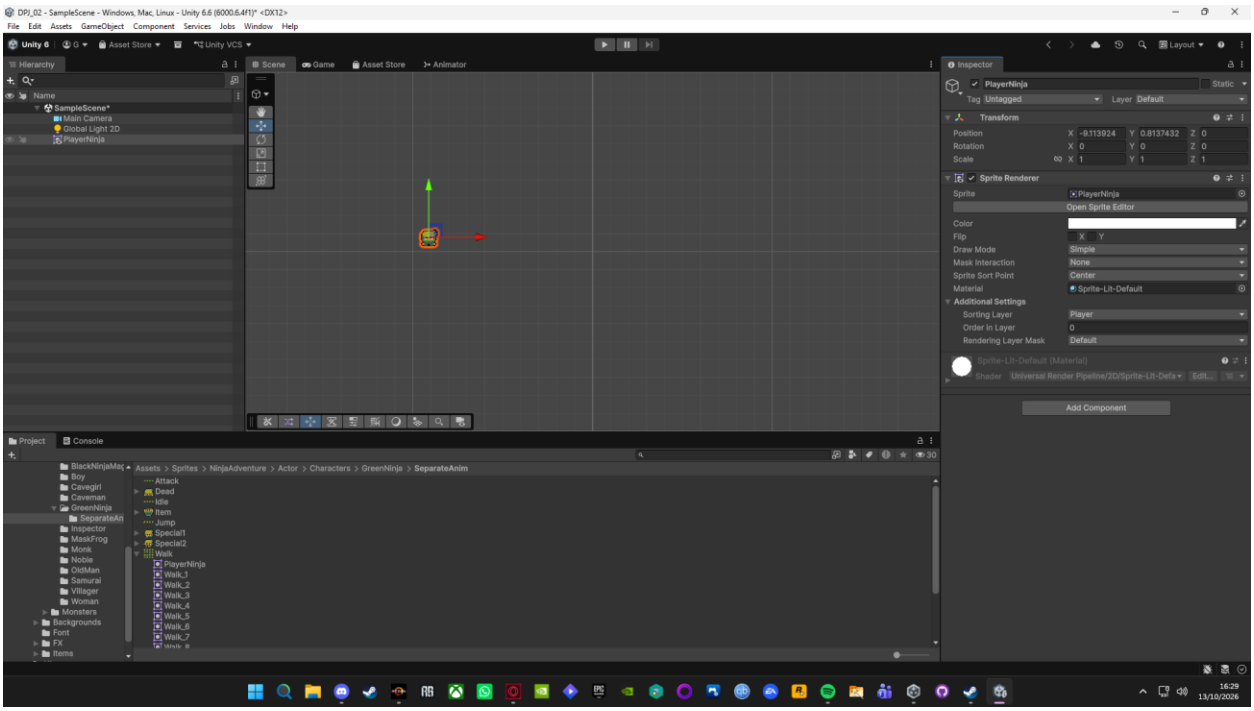

Created the Action Map

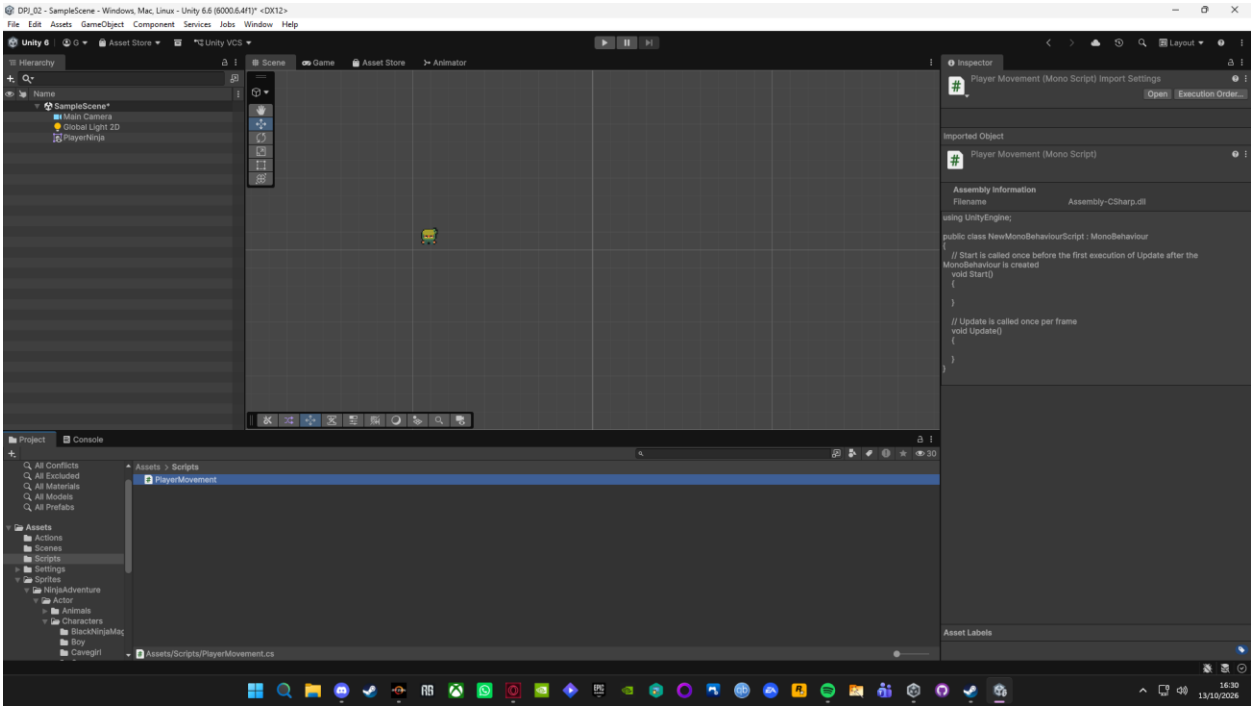

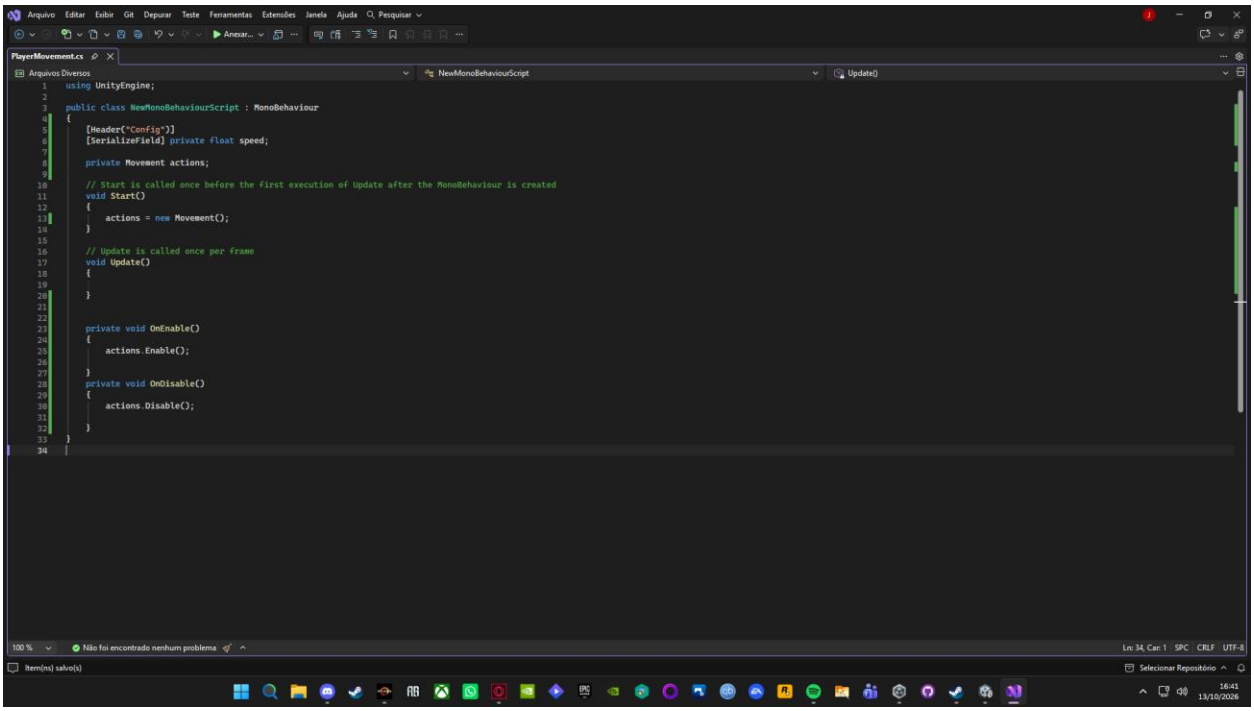

Here i create the Actions Movement 2 and Move and also sliced the walking sprite by grid cell x16 y16

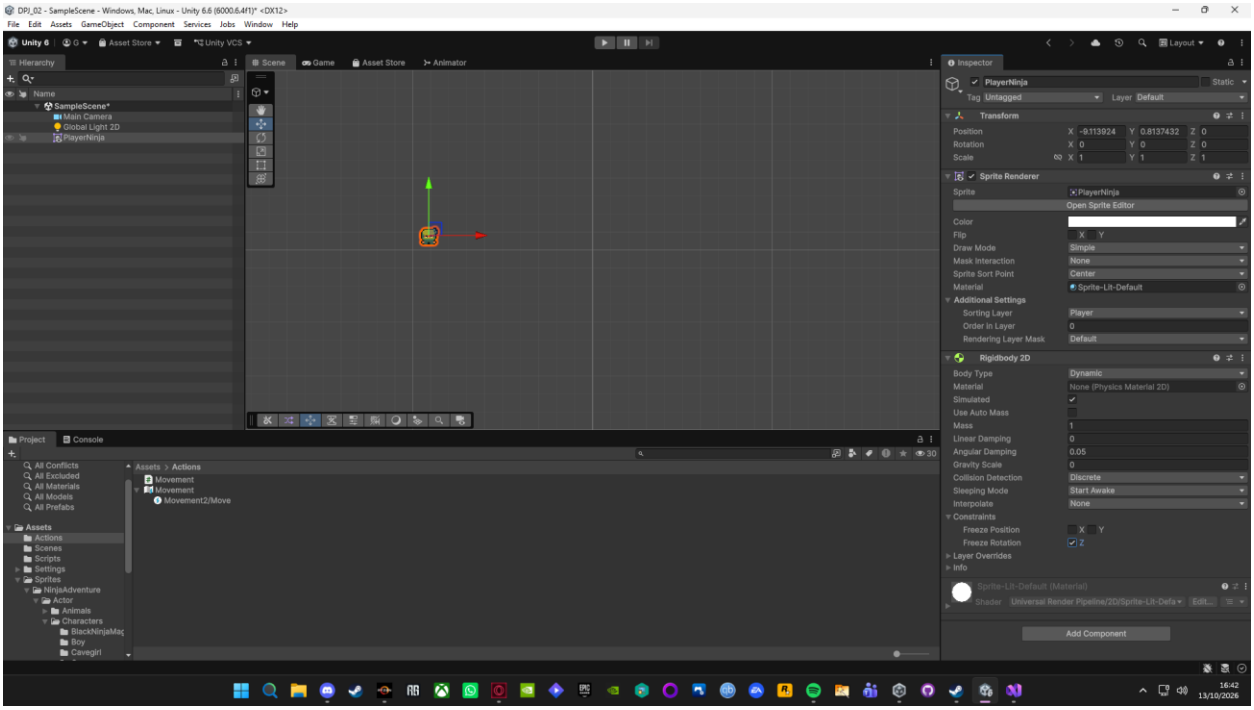

Here i created The Player Ninja Game object and also the scripts folder that contains the”PlayerMovement.cs”

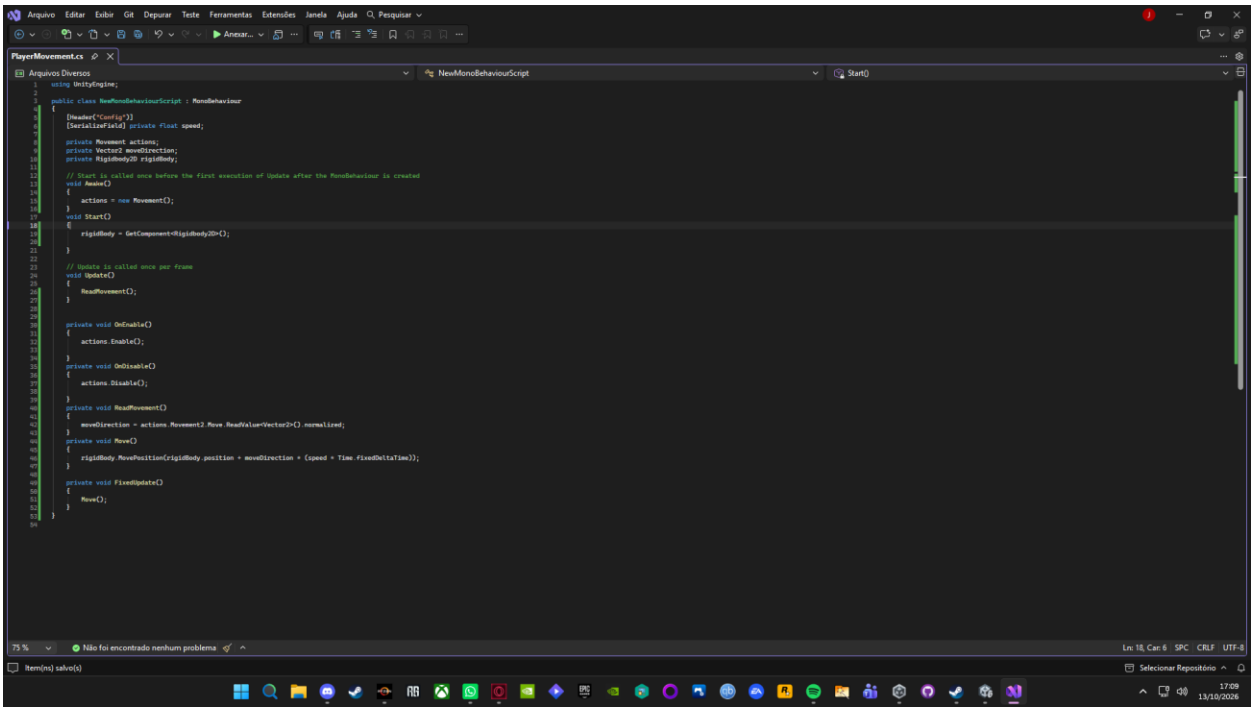

To the PlayerMovement script i added:Float speed,Movement actions, i initialized the actions on the start function and also created two more functions the OnEnable and OnDisable that will serve to deactivate the imput actions

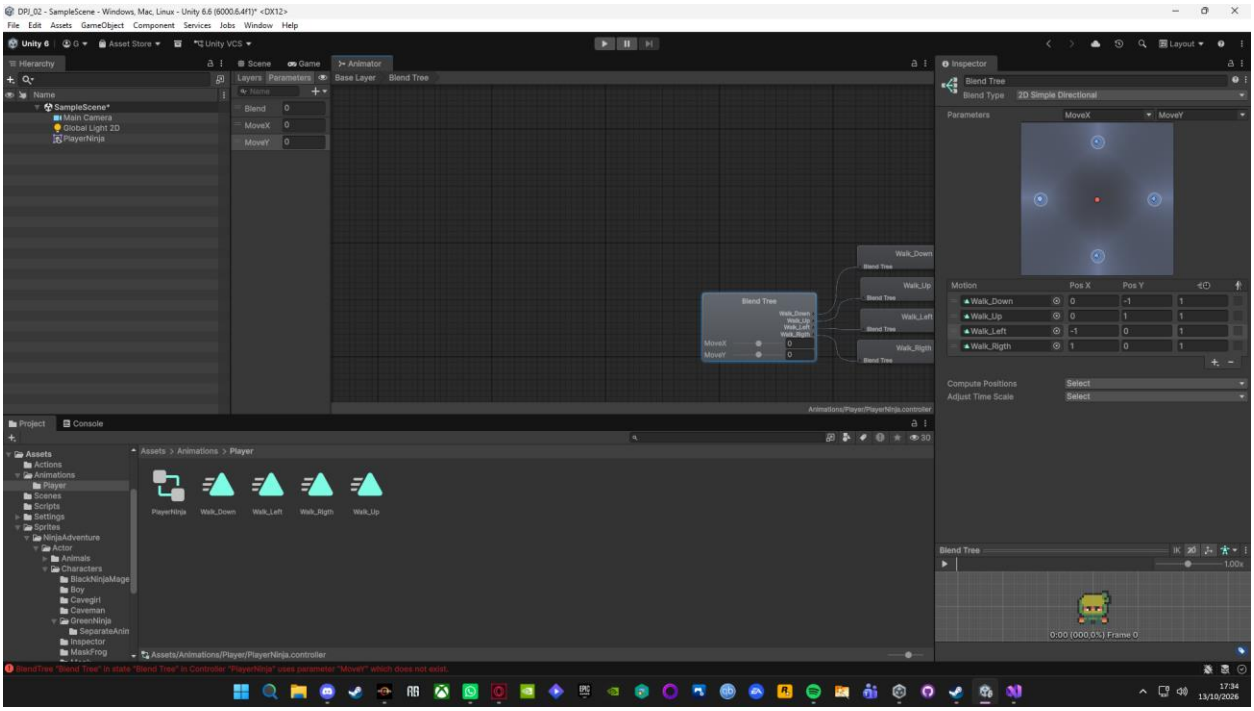

Here i added the component:RigidBody2D to my character and froze the Z axis rotation

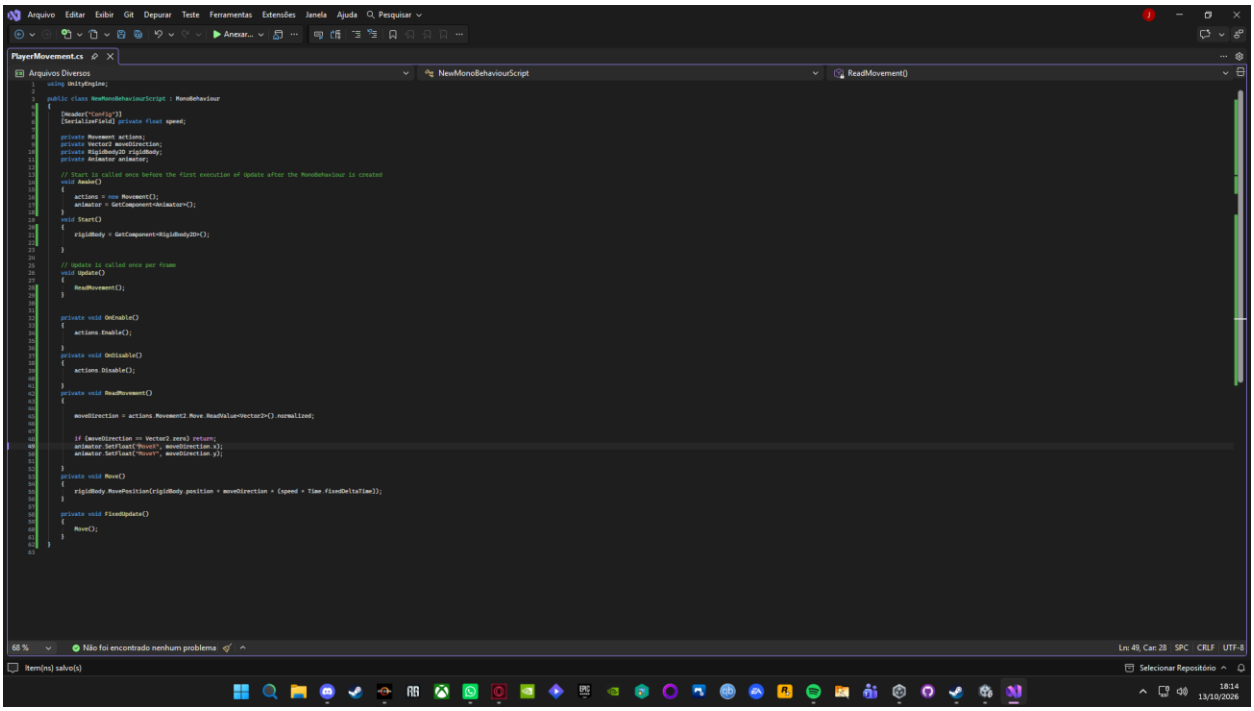

Here i added the ability for the PlayerMovement read player imput and use it to move around

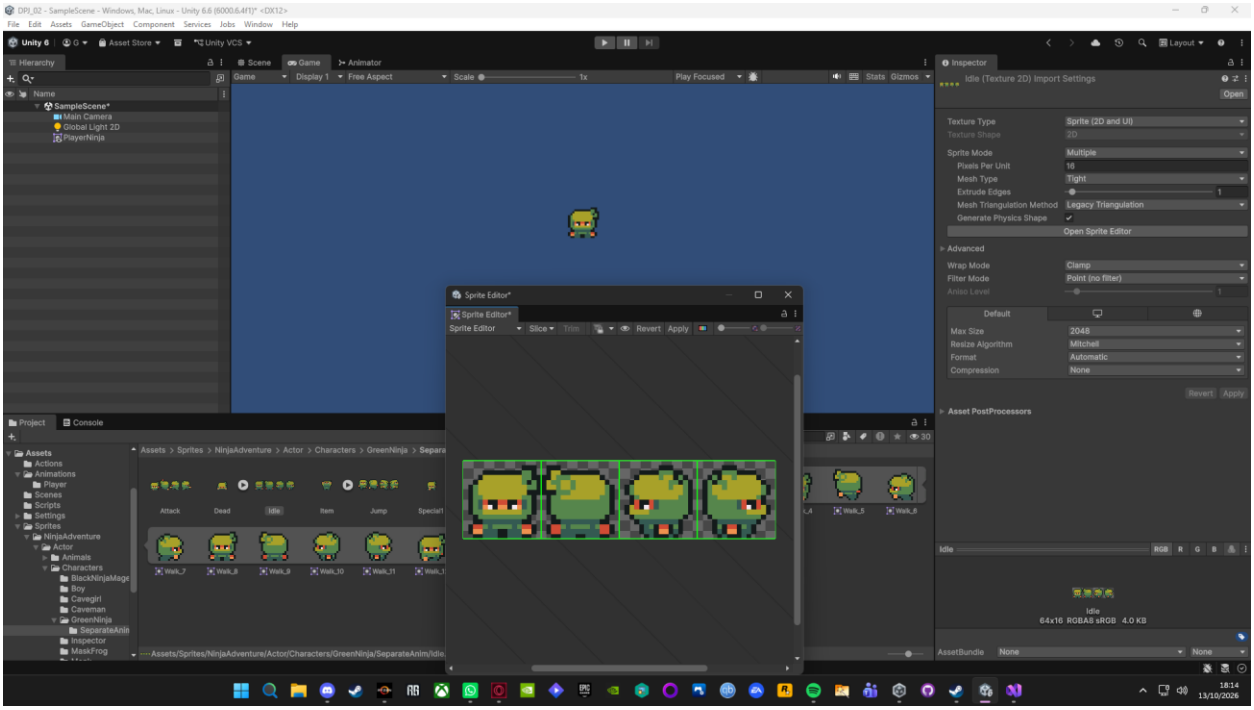

Bellow i connected all the animations i created for walking linking them to the blend tree

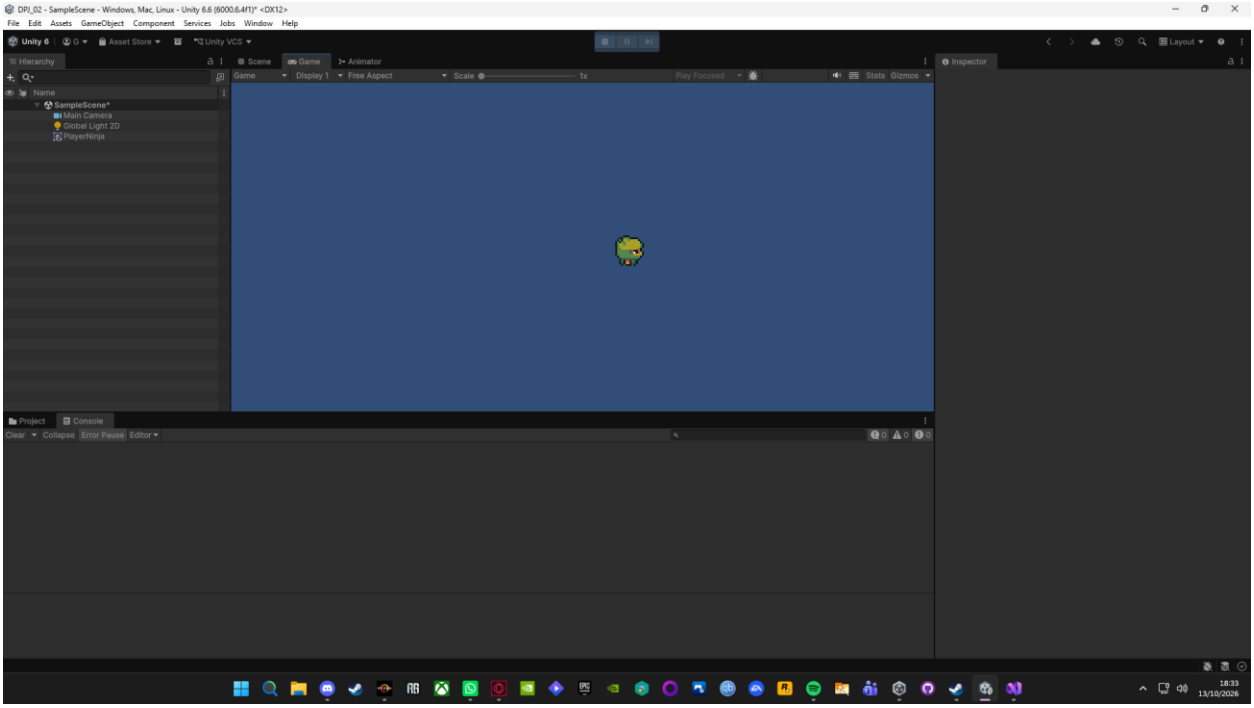

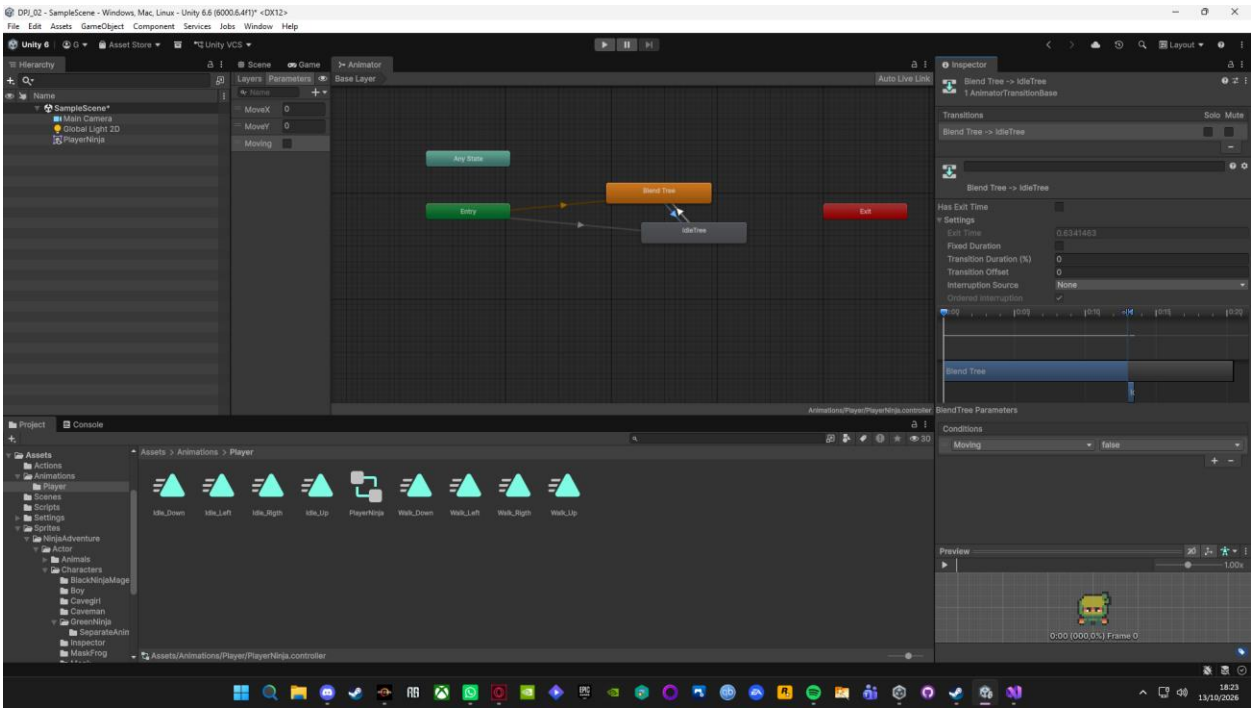

here i added a if check to the readmovement() so the animations match the imput

Bonus

Here i did the same with the idle animations
